## Define the number " e "

## Euler's number

The number $e$ is defined as the number that the expression

$$
\begin{equation*}
\left(1+\frac{1}{n}\right)^{n} \tag{2}
\end{equation*}
$$

approaches as $n \rightarrow \infty$. In calculus, this is expressed using limit notation as

$$
e=\lim _{n \rightarrow \infty}\left(1+\frac{1}{n}\right)^{n}
$$

Table 6

| $n$ | $\frac{1}{n}$ | $1+\frac{1}{n}$ | $\left(1+\frac{1}{n}\right)^{n}$ |
| ---: | :--- | :--- | :--- |
| 1 | 1 | 2 | 2 |
| 2 | 0.5 | 1.5 | 2.25 |
| 5 | 0.2 | 1.2 | 2.48832 |
| 10 | 0.1 | 1.1 | 2.59374246 |
| 100 | 0.01 | 1.01 | 2.704813829 |
| 1,000 | 0.001 | 1.001 | 2.716923932 |
| 10,000 | 0.0001 | 1.0001 | 2.718145927 |
| 100,000 | 0.00001 | 1.00001 | 2.718268237 |
| $1,000,000$ | 0.000001 | 1.000001 | 2.718280469 |
| $1,000,000,000$ | $10^{-9}$ | $1+10^{-9}$ | 2.718281827 |

## $\boldsymbol{e}$ (Euler's Number)

## $\square$

The number $\boldsymbol{e}$ is a famous irrational number, and is one of the most important numbers in mathematics.

The first few digits are:

$$
2.7182818284590452353602874713527 \text { (and more ...) }
$$

It is often called Euler's number after Leonhard Euler.

And Euler is spoken like "Oiler".
$\boldsymbol{e}$ is the base of the Natural Logarithms (invented by John Napier).
$\boldsymbol{e}$ is found in many interesting areas, so it is worth learning about.

## Calculating

There are many ways of calculating the value of $\boldsymbol{e}$, but none of them ever give an exact answer, because $\boldsymbol{e}$ is irrational (not the ratio of two integers).

But it is known to over 1 trillion digits of accuracy!
For example, the value of $(1+1 / \mathrm{n})^{\mathrm{n}}$ approaches $\boldsymbol{e}$ as n gets bigger and bigger:

| n | $(1+1 / \mathrm{n})^{\mathrm{n}}$ |
| ---: | ---: |
| 1 | 2.00000 |
| 2 | 2.25000 |
| 5 | 2.48832 |
| 10 | 2.59374 |
| 100 | 2.70481 |
| 1,000 | 2.71692 |
| 10,000 | 2.71815 |
| 100,000 | 2.71827 |

## Another Calculation

The value of $\boldsymbol{e}$ is also equal to $1 / 0!+1 / 1!+1 / 2!+1 / 3!+1 / 4!+1 / 5!+1 / 6!+1 / 7!+\ldots$ (etc)
(Note: "!" means factorial)
The first few terms add up to: $1+1+1 / 2+1 / 6+1 / 24+1 / 120=2.718055556$
And you can try that yourself at Sigma Calculator.

## Remembering

Or you can remember the curious pattern that after the " 2.7 " the number " 1828 " appears TWICE:

### 2.718281828

And following THAT are the angles $45^{\circ}, 90^{\circ}, 45^{\circ}$ in a Right-Angled Isosceles (two equal angles) Triangle:

### 2.718281828459045

(An instant way to seem really smart!)

## Advanced: Use of $\boldsymbol{e}$ in Compound Interest

Often the number $\boldsymbol{e}$ appears in unexpected places.
For example, $\boldsymbol{e}$ is used in Continuous Compounding (for loans and investments):

$$
e^{r-1}
$$

## Why does that happen?

Well, the formula for Periodic Compounding is:

$$
\begin{gathered}
\mathrm{FV}=\mathrm{PV}(1+\mathrm{r} / \mathrm{n})^{\mathrm{n}} \\
\text { where } \mathbf{F V}=\text { Future Value } \\
\mathbf{P V}=\text { Present Value } \\
\mathbf{r}=\text { annual interest rate (as a decimal) } \\
\mathbf{n}=\text { number of periods }
\end{gathered}
$$

But what happens when the number of periods heads to infinity?
The answer lies in the similarity between:

$$
(1+\mathrm{r} / \mathrm{n})^{\mathrm{n}} \quad \text { and } \quad(1+1 / \mathrm{n})^{\mathrm{n}}
$$

Compounding Formula
$\boldsymbol{e}$ (as n approaches infinity)
By substituting $\mathbf{x}=\mathbf{n} / \mathbf{r}$ :

- $\mathbf{r} / \mathbf{n}$ becomes $\mathbf{1 / x}$ and
- $\mathbf{n}$ becomes $\mathbf{x r}$

And so:

$$
(1+\mathrm{r} / \mathrm{n})^{\mathrm{n}} \quad \text { becomes } \quad(1+(1 / \mathrm{x}))^{\mathrm{xr}}
$$

Which is just like the formula for $\boldsymbol{e}$ (as $n$ approaches infinity), with an extra $\mathbf{r}$ as an exponent.
So, as $\mathbf{x}$ goes to infinity, then $(1+(1 / x))^{\mathrm{xr}}$ goes to $\mathrm{e}^{\mathbf{r}}$
And that is why $\boldsymbol{e}$ makes an appearance in interest calculations!

## Transcendental

e is also a transcendental number.
